Liposculpture; the 3.0 option in monterrey

Dissatisfied with your silhouette? Would you like to remove from here and add there? Liposculpture 3.0 in Monterrey, by NuBody, is your best choice. We literally shape your body contour, and consequently, improve your silhouette. Basically, during liposculpture, fat accumulations are extracted from areas we wish to reduce and are injected into areas of the body we would like to enhance. For example, fat can be extracted from the abdomen and injected into the buttocks and/or calves to better shape both areas.

WHAT IS LIPOSCULPTURE 3.0 BY NUBODY IN MONTERREY?

At NuBody Monterrey, we believe in the precision and detail that an aesthetic plastic surgery like Liposculpture entails. We also want this procedure to be as gentle and effective for the patient as it is for the performing doctor.

Previously, liposuction was performed using cannulas that forcefully removed the patient's fat, which meant wear and tear for the surgeon and more postoperative trauma for the patient, as well as blood loss.

Liposculpture is a surgical procedure that seeks to eliminate deposits of localized fat in specific areas of the body, such as the abdomen, thighs, buttocks, or arms. This technique not only helps improve aesthetic appearance but also can increase patients' confidence and emotional well-being, giving them a new perspective on their body and personal image.

Thanks to advancements in medical technology, all these issues have been addressed. Now, at NuBody, we use two important technologies: Vaser® Ultrasonic-Assisted Liposuction and also Power-Assisted Liposuction using Microaire or PAL.

Let us explain why they are so phenomenal:

VASER® LIPOSCULPTURE IN MONTERREY

Also called lipovaser, it is an advanced form of liposuction that uses gentle ultrasonic energy to selectively break down unwanted fat, preserving other important tissues. It offers the following advantages:

- Faster procedures
- More effective results
- Greater skin contraction
- Allows for marking of all areas
- Less bleeding
- Does not obstruct blood vessels
- Facilitates transfer
- Allows for treatment of all areas
- Minimal scarring
- Faster and less painful recovery
- Lower risk of skin burns due to ultrasound use

- Fewer bruises

POWER-ASSISTED LIPOSUCTION (PAL)

PAL® is the preferred and most used system as an alternative to manual liposuction. It offers the following advantages:

- Proven viability of cells
- Less bruising
- Less swelling
- Less surgeon fatigue
- Faster procedure

Additionally, Dr. Gabriel A. Mecott and his team have developed an exclusive procedure for liposculpture that treats extracted fat to filter it, removing large amounts of serum and blood, preserving the intact fat stem cell. This way, when transferring fat to another area of the patient's body, the volume lost will be much less than that of untreated fat transfer.

As you can see, the combination of all these technologies results in shorter surgeries with less risk for the patient, better results, finer point definition, less fatigue for your surgeon to pay attention to detail, leaving you looking spectacular.

At NuBody, you will find the best certified plastic surgeons in Monterrey, experts in these technologies.

LIPOSCULPTURE 3.0 NUBODY® DETAILS

During the liposculpture procedure, the plastic surgeon makes small incisions in the areas to be treated and uses a special device to remove excess fat in a controlled manner. This fat can then be processed and purified to be injected into other areas of the body where volume enhancement or shape improvement is desired. Liposculpture is performed under epidural or general anesthesia, depending on the individual needs of the patient, and can last several hours depending on the amount of fat to be treated and the areas to be sculpted.
